BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a 42 kDa C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against plasmodium falciparum. The nucleic acid sequence encoding MSP-1-42 has been modified (see AAX25586) compared to the native sequence (see AAX25587) such that 306 nucleotide positions have been replaced to lower the AT content (from 76 to 49.7%) and to eliminate 10 mRNA instability motifs while maintaining the same protein amino acid sequence. These alterations allow MSP-1-42 to be expressed in mammalian cell culture and in transgenic mice. The invention provides modified recombinant nucleic acid sequences and methods for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New modified recombinant nucleic acid sequences useful for producing malarial DNA vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       provides mountain the containing that are defined and increasing the mRNA levels and protein expression of proteins that are difficult to express in cell culture systems, mammalian cell culture systems or in transgenic animals. The preferred difficult protein candidates for expression are those derived from lower corganisms such as parasites, bacteria and viruses that have DNA coding sequences of high AT content or which have mRNA instability motifs or rare codons relative to the recombinant expression system to be used. The invention allows expression of MSP-1 protein in the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 AVTPSVIDNILSKIENEYEVLYLKPLAGVYRSLKKQLENNVMTFNVNVKDILNSRFNKRE

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Plasmoothm factoparum. The nucleic acid sequence encoding MSP-1-42 has been modified (see AAX56008) compared to the native sequence (see AAX56009) such that 306 nucleotide positions have been replaced to lower the AT content (from 76 to 49.7%) and to eliminate 10 mRNA instability motifs while maintaining the same protein amino acid sequence. These alterations allow MSP-1-42 to be expressed in mammalian cell culture and in transpenic mice. Native MSP-1-12 is known to be difficult to express in cell culture systems, mammalian cell culture systems or in transgenic animals. The invention allows expression of MSP-1 protein in the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1264 AVTPSVIDNILSKIENEYEVLYLKPLAGVYRSLKKQLENNVMTFNVNVKDILNSRFNKRE 1323

                                                                                                                         This present sequence comprises a 42 kDa C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against Plasmodium falciparum. The C-terminal end of the sequence is modified to include a 6xHis tag. Nucleic acids (see AAX25586 and AAX25593) encoding MSP-1-42 have been modified according to a method of the invention in order to improve expression in mammalian cells and in transgenic animals. The invention provides modified recombinant nucleic acid sequences and methods for increasing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New modified recombinant nucleic acid sequences useful for producing

This present sequence comprises a 42 kDa C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against.

Plasmodium falciparum. The C-terminal end of the sequence is modified to include a 6xHis tag. A nucleic acid (see AAX56008) encoding MSP-1-42 has been modified according to a method of the invention in order to improve expression in mammalian cells and in transgenic animals by reducing the AT content and removing mRNA instability motifs. The invention allows expression of MSP-1-42 in the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 nucleic

                                                                                                                                                                                                            Gaps
          to express in cell culture systems, especially mammalian cell culture systems or in transgenic animals. The preferred difficult protein candidates for expression are those derived from lower corganisms such as parasites, bacteria and viruses that have DNA coding sequences of high AT content or which have mRNA instability motifs or rare codons relative to the recombinant expression system to be used. The invention allows expression of MSP-1 in the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 nucleic acid.
'mRNA levels and protein expression of proteins that are difficult

                                                                                                                                                                                                                                                                                                                    The present sequence represents a 42 kDa C-terminal portion of manalaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against plasmodium falciparum. The sequence has been modified to include an N-terminal beta-casein signal peptide and an N-terminal office and an N-terminal office and introduced eliminate 2 N-glycosylation sites. These modifications allow the MSP-1-42 protein to be expressed in the milk of transgenic mice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   256 VFENLAKTVLSNLLDGNLQGMLQISQHQCVKKQCPQNSGCFRHLDEREECKCLLNYKQEG

                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a 42 kDa C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against plasmodium falciparum. The sequence has been modified to include plasmodium falciparum. The sequence has been modified to include on N-terminal beta-casein signal peptide and an N-terminal 6xHis tag. In addition, N1810 and N2620 mutations have been introduced to eliminate 2 N-glycosylation sites. These modifications allow the MSP-1-42 protein to be expressed in the milk of transgenic mice. The invention generally relates to modified recombinant nucleic acid sequences and methods for increasing the mRNA levels and cell culture systems, mammalian cell culture systems or in transgenic animals. The preferred difficult protein candidates for transgenic animals. The preferred difficult protein candidates for transgenic animals. The preferred difficult systems such as parasites, bacteria and viruses that have DNA coding sequences of high AT content or which have mRNA instability motifs or rare codons relative to the recombinant expression system to be used.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  VFENLAKTVLSNLLDGNLQGMLNISQHQCVKKQCPQNSGCFRHLDEREECKCLLNYKQEG 1563

The present invention relates to non-natural variants of a C-terminal fragment of a Plasmodium merozoite surface protein-1 (MSP-1). The mon-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of plasmodium MSP-1_4_2, and has the same affinity for at least MSP-1_2, compared to natural MSP-1_1_9. The non-natural variants of the present invention are useful for immunising a mammal against malaria, and can be used to treat malaria. The present sequence is MSP-133 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1443
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1444 LNYTYEKSNVEVKIKELNYLKTIQDKLADFKKNNNFVGIADLSTDYNHNNLLTKFLSTGM 1503

                                                                                                                                                             Major merozoite surface protein-1; MSP1-42; melittin signal peptide; malaria vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a major merozoite surface protein-1 C-terminal fragment of 42kDa (MSP1-42). This fragment is linked to amelittin signal peptide, and then expressed in a in a silkworm/baculovirus system. The protein is used to prepare a malaria vaccine, which is used to treat or prevent malaria, caused hany of the four species of Plasmodium that infect humans.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The polypeptide contains at least one epitope of the 190 kD precursor of the major merozoite surface antigen of P.falciparum. The polypeptide is immunogenic and can be used in vaccines to protect against malaria. Presence of the affinity peptide allows the polypeptide to be purified by affinity chromatography resins. Antibodies raised against the polypeptide are useful for diagnosis and for purificn. by affinity

New immunogenic polypeptides - derived from Plasmodium falciparum 190 kD surface antigen precursor useful in vaccines, and encoding DNA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The polypeptide contains at least one epitope of the 190 kD precursor of the major merozoite surface antigen of P.falciparum. The polypeptide is immunogenic and can be used in vaccines to protect against malaria. Presence of the affinity peptide allows the polypeptide to be purified by affinity chromatography resins. Antibodies raised against the polypeptide are useful for diagnosis and for purificn. by affinity chromatography.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence encodes a polypeptide which contains the unique sequence of the surface antigen of P. falciparum, but lacks the immunodominant repeat sequences which may allow the parasite to evade and decoy the immune system. The DNA for the stage-specific late schizoint-merozoite antigen 31-1 in p31-1 (W08503725) was modified to delete the entire sequence coding for the repitope. The expression plasmid, 31-1 Repeated Delete, was introduced into E.coli K12 to produce the modified peptide. The transformant has been deposited in the Deutsche Sammlung von Microorganismen as B.coli K12 (956936cl) (p31-1 Repeat Delete). The peptide was used in compsns. to treat and prevent protozoan parasitic infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            polypeptides - derived from Plasmodium falciparum 190 kD precursor, useful in vaccines, and encoding DNA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The polypeptide contains at least one epitope of the 190 kD precursor of the major merozoite surface antigen of P.falciparum. The polypeptide is immunogenic and can be used in vaccines to protect against malaria. Presence of the affinity peptide allows the polypeptide to be purified by affinity chromatography reasins. Antibodies raised against the polypeptide are useful for diagnosis and for purificn. by affinity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1069 AEIAETENTLENTKILLKHYKGLVKYYNGESSPLKTLSEESIQTEDNYASLENFKVLSKL 1128

                                                                                                                                                                                                                                                                                                                                                                                                                      This is the amino acid sequence of a recombinant protein comprising amino acids 1613-1705 of the Plasmodium falciparum merozoite surface protein 1 (MSP1) 19 kD C-terminal fragment (p19), linked to a glycosylphosphatidylinositol membrane anchoring sequence. p19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1526 NISQHQCVKKQCPQNSGCFRHLDEREECKCLLNYKQEGDKCVENPNPTCNENNGGCDADA 1585

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the amino acid sequence of a recombinant protein comprising amino acids 1613-1705 of the Plasmodium falciparum merozoite surface protein 1 (MSP1) 19 KD C-terminal fragment (p19), linked to a glycosylphosphatidylinositol membrane anchoring sequence. p19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1..95

                                                                                                                                                                                                                                                                                                                                                                                                    1 QLSFDLYNKYKLKLERLFDKKKTVGKYKMQIKKLTLLKEQLESKLNSLNNPKHVLQNFSV 60
                                                                                                                                                                                  invention relates to a malaria vaccine comprising an expression vector, preferably a defective Venezuela equine encephalitis (DVEE) fragment after administration to a patient. The pli5MSP-1 protein or fragment raises a humoral and/or cell-mediated response to the erythrocytic merozoite malaria antigen, protecting the patient from continues to express antigen in the patient for a subsequent malaria infection. The DVEE viral vector system continues to express antigen in the patient for a period of days, months or even years. The pl15MSP-1 antigen may also include and/or an anchor peptide sequence, which enhances the immunogenic response of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                   1062 FFNKKKEAEIAETENTLENTKILLKHYKGLVKYYNGESSPLKTLSEESIQTEDNY 1116

                                                                                                                                                                                                                                 The present invention relates to non-natural variants of a C-terminal fragment of a Plasmodium merozoite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2. The non-natural variants of the present invention are useful for immunising a mammal against malaria, and can be used to treat malaria. The present sequence is MSP-119 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1520 NLQGMLNISQHQCVKKQCPQNSGCFRHLDEREECKCLLNYKQEGDKCVENPNPTCNENNG 1579

vaccines against P. falciparum infection compitising (I) or (II).

(I) and (II) are useful for the development of vaccines against

P. falciparum infection. (I) and polyclonal antitisera or a monoclonal

antibody raised to immunogens comprising the sequences of (I), are

useful in the detection of infection with P. falciparum. Furthermore,

(I) (especially when they are rifins or secreted or membrane proteins)

can aid the identification of farugs to treat or prevent P. falciparum.

CC an idection, or they can be used to identify drug resistance in

infection, or they can be used to identify drug resistance in

CC P. falciparum. Sequencing of the Plasmodium chromosome 2 and the

c subsequent identification of proteins encoded by it will help to expand

cour understanding of parasite biology, a process hampered by the

couplexity of the parasite infectode, and provide new targets for

vaccine and drug development. Parasite resistance to drugs and mosquito

resistance to insecticides have led to a resurgence of malaria in many

cracine and drug development and there is a pressing need for vaccines and new

cracines. AAA70078 to AAA70287 and AAB18135 represent nucleotide

and protein sequences given in the present inventon, but which are not

conspecticially mentioned within the specification. Also described are: (1) nucleotide sequences (II) encoding (I); and (2)

p19

```
This is the amino acid sequence of a chimeric protein comprising amino acids 1-32 of the plasmodium vivax merozoite surface protein 1 (MSP1) linked to amino acids Asn1613-Ser1705 which correspond to the 19 KD C-terminal fragment (pl9) of MSP-1 from Plasmodium falciparum. ppl is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1526 NISQHQCVKKQCPQNSGCFRHLDEREECKCLLNYKQEGDKCVENPNPTCNENNGGCDADA 1585

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to non-natural variants of a C-terminal fragment of a plasmodium merczoite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1.4.2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of plasmodium MSP-1.4.2, compared to natural MSP-1.1.9. The present sequence is the wild-type MSP-1 protein. This sequence was used to generate the variants of the present thuvention. The non-natural variants of the present unvention are useful for immunising a mammal against malaria, and can be used to treat malaria.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the amino acid sequence of a chimeric protein comprising amino acids 1-32 of the Plasmodium vivax merozoite surface protein 1 (MSP1) linked to amino acids Asn1613-Ser1705 which correspond to the 19 kD c-terminal fragment (P19) of MSP-1 from Plasmodium falciparum. P19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the P19 fragment provides a high level of protective immunity since it includes epitopes not presented in the P42 fragment.

```
AAW24575 and AAW24576 represent the merozoite apical end proteins (MAEP) isolated from two different Plasmodium vivax strains. These proteins are the antigens of the invention, and immunoreact with antibodies against a native MAEP sequence. P. vivax is one of the four malarial species that infects humans, and is difficult to target for a vaccine, as it cannot be cultured in vitro. The preinvasion orientation of malarial merozoites indicates that the apical end plays an important role in the invasion process. The MAEP protein binds to the surface of susceptible crythrocytes from P. vivax susceptible humans and primates, and also binds to rabbit erythrocytes. The antigen can be used for the production of antimalarial vaccines. The antigen can be used for the production of antimalarial oparticularly P. vivax) blood stage parasites. Synthetic apints malaria (particularly P. vivax) blood stage parasites. Synthetic process, and are immunochemically reactive with antibodies raised antigens can be used similarly. As the antigens specifically bind to a configuration of red blood cells), and are necessary in the process of invasion of red blood cells by a malarial organism. The antigens can also be used in a method for inhibiting the propagation of a malarial organism in susceptible red confining the propagation of a malarial organism in susceptible red
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         71;

encoded The present invention describes proteins and their fragments (1) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (1) nucleotide sequences (II) encoding (1); and (2) vaccines against P. falciparum infection comprising (I) or (II). (1) and (II) are useful for the development of vaccines against antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Purthermore, useful in the detection of infection with P. falciparum. Purthermore, (I) (especially when they are rifins or secreted or membrane proteins) 1153 LIAELKEVIKNKNYTGNSPSENNTDVNNALESYKKFLPEGTDVATVVSESGSDTLEQSQP 1212 1213 KKPASTHVGAESNTITTSQ---NVDDEVDDVIIVPIFGESEEDYDDLGQVVTGEAVTPSV 1269 1270 IDNILSKIENEYEVLYLKPLAGVYRSLKKQLENNVMTFNVNVKDILNSRFNKRENFKNVL 1329 1124 ----VSKIFNT------VLDTQKSNIVTNQHSIN-NVKDKLKGK-----LQELI 1161 1330 ESDLIPYKDLTSSNYVVKDPYKFLNKEKRDKFLSSYNYIKDSIDTDINFANDVLGYYKIL 1389 ::| |::| ::| |::| 1162 DAD-------GSFTL------ESIKKFNEIYSHIKTNI------GELEQL 1192 1093 KYYNGESSPLKTLSEESIQTEDNYASLENFKVLSKLEGKLKDNLNLEKKKLSYLSSGLHH 1152 1009 KNYEDTVQDVLTLNEHF-----NTKQVSNHEPTNFDKSNKSSEELTKAVTDSKT 1057 Plasmodium falciparum; chromosome 2; human malaria parasite; vaccine; antimalarial; malaria; protozoacide; infection; insecticide. 1390 SEKYKSDLDSIKKYINDKQGENEKYLPFLNNIETLYKTV-NDKIDLFVIHLEAKVLN 1445 Proteins encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum, useful as antimalarial vaccines and in the diagnosis of P.falciparum infection Plasmodium falciparum chromosome 2 related protein SEQ ID NO:29 Venter JC; Disclosure; Page 75-82; 577pp; English.                                                                                   Ω
can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in subsequent identification of the Plasmodium chromsome 2 and the complexity of the parasite biology, a process hampered by the complexity of the parasite lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insectiodes have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70078 and AAB18144 to AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the specification.

                                                                                         δy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ANH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis.

(I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the used to produce the used to produce hosts cells which express the polypeptides. (II) (and/or nucleic acids) may then be polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AH55091 to AAH55098 represent oligonucleotide sequences and primers which are used in the present invention of the present present specification, N. B. The present invention specifically claims all the polynucleotide sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4455 to 4472, no sequences are present for SEQ ID NO:4455 to 4472,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        84;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3208
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  412
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                107 NSRRTNPSDNSSDSDAKSYADLKHRVRNYLLTIKELKYPQLF--DLTNHMLTLCDN---- 160

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes; colymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The cand gene mapping, and in recombinant production of (II). The cand gene also used in diagnostics as expressed sequence tags correlated for interesting and in gene therapy techniques contention of (II) is useful for generating antibodies against it, detecting or canditating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical calsorders involving abereant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other trails to assess biodiversity and to produce other types of data and products dependent on DNA and and conding sequences. ABGOO010-ABG30377 represent novel human of adagnostic mainto acid sequences of the invention.

Specification, but was obtained in electronic format directly from WIPO

immunosuppressant and cytostatics activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to tread diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as Alzheimer's, parkinson's disease, amyotrophic lateral sclerosis, and disease, Huttington's disease, such as Alzheimer's, parkinson's disease, Huttington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/Inhibin activity, chemotectic/chemokinetic activity, mannestatic and thrombolytic activity, arthritis and inflammation, leukaemias and C.N. S disorders.

Note: The sequence data for this patent did not form part of the printed specification. 82; AKRKRRVTWCLGKINKMKNSNYADQFNIPTNITTKTHKLSINLLREIDESVCSESDVFSN 498 557 --KEIKEIAKTIK--- 362 491 913 MEQLKEQLENRDSPLQTVEREKTLITEKLQQTLEEVKTLTQEKDDLKQLQESLQIERDQL 972 --LKKLVFG---YRKPLDN-----IKDNVGK 237 LDEFEALERKTKKDQEMQLIHEISNIKNIVKHREVYNQDLENELSSKVELLREKEDQIKK 617 LIDGYEEI-----PFNLKINFYFDL--LRAKLNDVCANDŸCQI-----PFNLKIR-ANE -TID-KNKNATKEEEKKKL YQAQYDLSIYNKQLEEAHNLISVLEKRIDTLKKN--ENIKELLDKINEIKNPPPANSGNT -----FNIDSLFTDPLELEY ----YLREKNKNIDISAKVËTKESTEPNEYPNGVTYPLS ELHIITSEKDKLFSEVVHKESRVQGLLEEIGKTKDDLATTQSNYKSTDQEFQNFKTLHMD FEQKYKMVLEENERMNQEIVNLSKEAQKFDSSLGALKTELSYKTQELQEKTREVQERLNE INEIKEKIK -----IEKKK -----IESKK SYEDRSKSLNDITKEYEKL LESVIAEKEQL - - - KTDLKENIEMTIENQEELRLLGDELKKQ - QEIVAQEKNHAIKKEGE -----NSFGDLINPFDY-TKEPSKNIYTDNERKKF LNEIYDSKFNNNIDLTNFEXMMGKRYSYKVEKLTHH----NTFAS----YEN ---SKHNLEKLTKALKYMEDYSLRNI------VVEKELKYYKNLISKIENEIETL VENIKKDEEQLFEKKITKDEN-----KPDEKILEVSDIVKVQVQKVLLMNKIDELKKTQL Length 2688; Indels 559; encoded polypeptides (AAM38642-AAM42213) with nootropic DB 22; 616; Query Match 5.3%; Score 444.5; DB Best Local Similarity 18.4%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes proteins and their fragments (1) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (1) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against P. falciparum infection. (1) and polyclonal antisera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the Plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand our understanding of the plasmodium chromosome 2 and the complexity of the parasite blology, a process hampered by the complexity of the parasite ilfecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               94;

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM8642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Note: The sequence data for this patent did not form part of the printed

The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (I) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against p. falciparum infection. (I) and polyclonal antisers or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the Plasmodium chromosome 2 and the

52; parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB18144 to AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the specification. subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasite lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many 396 628 685 121 KELINNLNDISDELKNCIEQVNSVSRNMANVEKEKENIINĖLQILRMKNDTMRKRISKFV 180 286 -----KLNEEIKRRNSF---IKNKDRKIDLLTNIENELLKKKEINNIKLMEKQNVIKN 336 KKKCIENLKDELINIKKKMEDKMHMTNEMDLL----SNKVEELNRIN--KTYEKNIVELN 450 NELDVIKKKLNDEEFLKEEEKKKNIDMVYKIKEYEIQIKEKENEIDSLKKNEONLHVLKN 510 647 803 861 --KEEMGL 729 862 NLYKLKDNDKIKNLL---EEAKKVSTSVKTLSSSSMQPLSLTPQDKPEVSANDDTSHSTN 918 ELLYKLNFYFDLLRAKLNDVCANDYCQIPFNLKIRANELDVLKKLVFGYRKPLDN----I 231 232 KD-----NVGKMEDYIKKNKKTIENINEL---IEESKKTIDKN---KNATKEEEKKKL 278 ----DILKKNENIKELLDKINEIKNPPPANSGNTPNTLLDKNKKIEEHE 351 KEIKEIAKTIKFNIDSLFTDPLELEYYLREK--NKNIDISÄKVETKES--TEPNEYPNGV 407 457 ----KKKIËSDKKSYEDRSKSLNDITKE 487 Gaps ELILKKKNY-EELRLKLNHL----ECVERDSVKIN-SEKEKGEKVIYELKEKLDNDEKII 60 -----EEAHNLISVLE------KRI----337 NEQLLKDIKDENEKMNEHVNKLQNELIKRELQNKCISKDIĘFCKKEKEDKIKNLEDDLLE HNLEKLTKALK----YMEDYSLRNIVVEKELKYYKNLISKIENEIETLVEN----IKKD EBNKKELKREKRVCDMNLQSQILIKENEKHMQEKVEEYKNLLKQKDQELKNIIQEYDERI 686 NEEKKNIKTEGQSDNSEPSTEGEITGQATTKPGQQAGSALEGDSVQAQAQEQKQAQPPVP -DIVNDCEEKLKQAK----746 VPVPEAKAQVPTPPAPVNN--KTENVSKLDYLEKLYEFLNTSYICHKYILVSHSTMNEKI -----NDLMKDME EQEKVLKFKLYTLNNDIFSKNEKLNDMQKKLNDV-NEKYKNIVECLNNYKTEHK--EQIE 488 YEKLLNEIYD-----SKFNNNIDLINFEKMMGKRYSYKVEKLTHHNTFASYENS----K EEQLFEKKITKDENKPDEKILEVSDIV----KVQVQKVLLMNKI------DELKKTQLILKNV---ELKHNIHVPNSYKQENKQEPYYLIVLKKEIDKLKVFMPKVESLI LKQYKITK - - EEESKLSSCDPLDLLFNIQNNIPVMYSMFDSLNNSLSQLFMEIYEKEMVC Indels 354; ; Length 980; TYPLSYNDINNALNELNSFGDLINPFDYTKEPSKNIYTDNERKKFINEIK-Query Match 5.1%; Score 431; DB 21; Best Local Similarity 23.1%; Pred. The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity 1028 Y-KMQIKKLTLLKEQLESKLNSL----NNPKHVLQNFSVFFNKKKEAE-IAETENTLEN 1080 979 NSLNDESKRK-----KLEEDINKLKKTLQLSFDLY--NKYKLKLERLFDKKKTVGK 1027 ------KKKNEEE----KERNEET LINNSLKLFENILSLGKNKNIYQELIGQKSSENFYEKILKDSDTFYNESFTNFVKSKADDI New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess 814 EHOKEDRKRKDKKKKGHSSDKEEKYNKKEKTKEKSSNILFDEEYIIQLEELRDTGENCFI i; chromosome mapping; gene mapping; gene therapy; forensic; supplement; medical imaging; diagnostic; genetic disorder.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence represents a Plasmodium vivax merozoite surface protein (MSP) C-terminal region. The C-terminal region of the merozoite surface protein has a strong antigenicity in malarial diseases. For diagnosis of malaria, recombinant proteins with hahneed antigenicity, obtained by addition of fusion proteins to surface protein C-terminal regions, can be reacted with serum or blood of a Plasmodium infected patient. Antigen-antibody composites will be formed, and these are detected by Enzyme Linked Immunosorbent Assay (ELISA). The recombinant antigens provide a quick and reliable diagnosis of malaria, with good sensitivity
                                                                                                                                                                                                                                                                                                                                                                                                                                          New gene encoding merozoite surface protein of Plasmodium vivax, useful for producing protein for diagnosis of malaria and for vaccination -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1425 YKTVNDKIDLFVIHLEAKVLNYTYEKSNVEVKIKELNYLKTIQDKLADFKKNNNFVGIAD 1484

The fractions are accounted by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (1) nuclectide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

(1) and (II) are useful for the development of vaccines against antibody raised to immunogens comprising the sequences of (I).

(2) antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, and the identification of fungs to treat or prevent P. falciparum infection, or they are rifins or secreted or membrane proteins) and the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many drugs. Ana/10078 to Ana/10287 and Analasis represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the specification.
                                                                                                                                                                                                                                                                          The present invention describes proteins and their fragments (I) encoded
                                                                                                          Proteins encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum, useful as antimalarial vaccines and in the diagnosis of P.falciparum infection -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (I) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

C vaccines against P. falciparum infection or monoclonal infection. (I) and polyclonal aprilsers or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of farugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in infection, or they can be used to identify drug resistance in complexity of the parasite biology, a process hampered by the complexity of the parasitic lifecycle, and process hampered by the complexity of the parasitic lifecycle, and process hampered by the complexity of the parasitic lifecycle, and process hampered by the complexity of the world, and there is a pressing need for vaccines and new concent and drug development. Parasite resistance to drugs and new concent and protein sequences given in the present invention, but which are not specifically mentioned within the specification.

the present inverticul usersities proteins and utelf iragments (1) encoded are confirme present inverticul usersities, plasmodium falciparum.

Also described are: (1) nucleotide sequences (11) encoding (1); and (2) of accines against P. falciparum infection comprising (1) or (II).

(I) and (II) are useful for the development of vaccines against C. (1) and (II) are useful for the development of vaccines against consistent in the detection. (1) and plyclonal antisera or a monochonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in falciparum. Sequencing of the plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand to our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for resistance to insecticides have led to a resurgence of malaria in many contine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many carbones of the world, and there is a pressing need for vaccines and new carbones and many carbones of the world, and there is a pressing need for vaccines and new carbones and many carbones and ma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  105;
